Let y be a function of t . An equation in t and the derivatives of y is called a differential equation.

E.g. $y'' - y = 0$ (or, equivalently, $y''(t) - y(t) = 0$)

$$\Leftrightarrow y'' = y.$$

What functions satisfy this? They are solutions to the differential equation.

For $y'' = y$, it turns out that all solutions are of the form

$$y = ae^t + be^{-t}$$

for some a, b constants.

Check that these work:

$$(ae^t + be^{-t})'' = (ae^t - be^{-t})'$$

$$= ae^t - (-be^{-t})$$

$$= ae^t + be^{-t} \quad \checkmark$$

This is a "two-parameter family of solutions."

To specify a particular sol'n, we need two initial conditions.

For instance, $y(0) = 0$, $y'(0) = 1$.

$\underbrace{\hspace{1.5cm}}$ initial position $\underbrace{\hspace{1.5cm}}$ initial velocity

$$0 = y(0) = ae^0 + be^{-0} = a + b$$

$$y'(t) = ae^t - be^{-t}$$

$$1 = y'(0) = a - b$$

$$2a = 1 \Rightarrow a = \frac{1}{2}$$

$$\Rightarrow b = -\frac{1}{2}$$

so for the given initial position and velocity, the unique sol'n is

$$y = \frac{1}{2}(e^t - e^{-t})$$

Q What if $y(0) = -1$, $y'(0) = 1$?

$$-1 = y(0) = a + b$$

$$+ \quad 1 = y'(0) = a - b$$

$$0 = 2a \Rightarrow a = 0 \Rightarrow b = -1.$$

A $y = -e^{-t}$

Q What if $y(0) = y'(0) = 0$?

A $a+b = y(0) = 0$
 $a-b = y'(0) = 0 \Rightarrow a=b=0 \Rightarrow y=0.$

E.g. First order equation $ty'(t) = 3y(t)$.

Then $\frac{y'}{y} = \frac{3}{t}$ — the equation is separable:
we can get y 's on one side
of the eq'n, t 's on the other.

Integrate: $\int \frac{y'}{y} dt = \int \frac{3}{t} dt$

$$\text{RHS} = 3 \log(t) + C$$

$$\text{LHS} = \int \frac{1}{u} du = \log(u) + \tilde{C} = \log(y) + \tilde{C}$$

$u=y, du=y'dt$

Thus $\log(y) = 3 \log(t) + k = \log(t^3) + k$

for some constant k .

Exponentiating,

$$e^{\log(y)} = e^{\log(t^3) + k}$$

$$\Rightarrow y = e^{\log(t^3)} e^k$$

$$\Rightarrow y = K t^3 \text{ for } K \text{ some positive constant}$$

If $y(1) = 1$ then $K=1$ and $y = t^3$.

Problem Solve $y' = \frac{3t}{y}$

- (a) in general, and
(b) subject to initial condition
 $y(0) = 5$.

$$yy' = 3t$$

$$\int yy' dt = \int 3t dt$$

$$\begin{aligned} u &= y \\ du &= y' dt \end{aligned}$$

$$\int u du = 3 \frac{t^2}{2} + C$$

$$\frac{u^2}{2} + \tilde{C} = 3 \frac{t^2}{2} + C$$

$$\frac{y^2}{2} + \tilde{C} = \frac{3}{2} t^2 + C$$

$$y^2 = 3t^2 + k$$

$$y = \pm \sqrt{3t^2 + k}$$
